New ways to engage with research

Research with Impact

How evidence-based are we?

Somewhat!

• Still can’t get evidence when we need it
• Steadily increasing volume of it
• Increasing workload and burden of service reorganisation
• Less time to do it
• Increasing variation in practice, use of unproven treatments
Can we fix the evidence?

Evidence is (still) written for researchers, not practitioners or patients.

- About half of it doesn’t get published.
- About half of what’s left is biased.
- Lots remains locked away behind paywalls and on disparate platforms.
- There remains a critical appraisal skills gap.
The opportunity

Blogs and digital media can reach parts other media cannot reach

- Putting evidence in **context**
- **Search-friendly**
- **Open access**
- **Pushed** content
- **Sharing** critical appraisal skills
- New learning **opportunities**
- **Constructive & democratic engagement** between the public, researchers, professionals & policy makers

Effectiveness and cost-effectiveness of mindfulness-based cognitive therapy compared with maintenance antidepressant treatment in the prevention of depressive relapse or recurrence (PREVENT): a randomised controlled trial

- PREVENT RCT
- Published in The Lancet, 21/04/15
- Significant findings
- Impact on clinical practice?
Who needs to know?

- People with recurrent depression & their carers
- Health & social care professionals
  - GPs
  - Mental health professionals
  - Mindfulness practitioners

What the paper concludes

“We found no evidence that MBCT-TS is superior to maintenance antidepressant treatment for the prevention of depressive relapse in individuals at risk for depressive relapse or recurrence.”
On 20 Apr 2015, at 09:29, Lancet, Press Office <pressoffice@lancet.com> wrote:

**The Lancet**: Mindfulness-based therapy could offer an alternative to antidepressants for preventing depression relapse

**Note short embargo: 00:01 [UK time] Tuesday 21 April, 2015**

Mindfulness-based cognitive therapy (MBCT) could provide an alternative non-drug treatment for people who do not wish to continue long-term antidepressant treatment, suggests new research published in *The Lancet*.

The results come from the first ever large study to compare MBCT – structured training for the mind and body which aims to change the way people think and feel about their experiences – with maintenance antidepressant medication for reducing the risk of relapse in depression.

The study aimed to establish whether MBCT is superior to maintenance antidepressant treatment in terms of preventing relapse of depression. Although the findings show that MBCT isn’t any more effective than maintenance antidepressant treatment in preventing relapse of depression, the results, combined with those of previous trials, suggest that MCBT may offer similar protection against depressive relapse or recurrence for people who have experienced multiple episodes of depression, with no significant difference in cost.
Mindfulness as effective as pills for treating recurrent depression
The Guardian

Mindfulness 'as good as anti-depressants for tackling depression'.
The Daily Telegraph

Depression: 'Mindfulness-based therapy shows promise'.
BBC News
Conclusion of our blog

“This RCT does not establish equivalence between mindfulness-based cognitive therapy (MBCT) and antidepressants for recurrent depression, but it does show MBCT in a positive light for preventing depression.”
Mindfulness: putting the marketing cart before the evidence horse?
Digital dissemination

- Blog
- Social media stuff
- Podcast
- Webinar
I fell into an avalanche,
it covered up my soul
Mindfulness-based cognitive therapy (MBCT) and mindfulness in general have been pretty hot topics in the woodland over the last couple of years. A growing number of reliable studies have been published that show the benefits of this approach for a wide range of mental health conditions.
The social media stuff:
Extensive dissemination and democratic conversation.

Plus #WeCATS critical appraisal training
The podcast: interview with lead researcher, detailed discussion of mindfulness practice and mindfulness-based interventions.
The webinar: live streamed EBMH hangout supported by Twitter

Digital engagement opens doors!
Conclusion

• Digital publishing is here to stay
• If you don’t do it, you’re at a disadvantage
• Real opportunities for adding value to research dissemination
• Democratic discussion of the evidence
• Partnership working is essential
• Engagement is the aim, not vanity analytics!
• So how can we do this systematically?
No bias, no misinformation, no spin
Just what you need!
